Sharp integral inequalities based on general three-point formula

Annals of the University of Craiova, Mathematics and Computer Science Series 39 (2012), 2; 132-147

Abstract. In this paper we establish the families of general three-point quadrature formulae, by using the generalization of the weighted Montgomery identity via Taylor's formula. The results are applied to prove a number of inequalities which give error estimates for the general three-point formula and for three-point Gauss-Chebyshev formulae of the first and of the second kind.
